

Dependency & Security Notice: NovaTrack and Rehab

Overview

The **NovaTrack (Railway)** and **Novapoint Rehab (Road)** modules are currently built using the Microsoft Visual C++ 2008 environment. These modules require the **Microsoft Visual C++ 2008 Redistributable (x86)** to function correctly. This redistributable will be installed with the installation of NovaTrack and Novapoint Rehab.

Microsoft Visual C++ 2008 has reached **End-of-Life (EOL)** status. Consequently, it no longer receives:

- Critical security patches
- Stability updates
- Technical support from Microsoft

To maintain a robust security posture for the broader **Novapoint platform**, these mentioned legacy components have been separated from the core installation setup. This modular approach reduces the system's "attack surface"—limiting potential exposure to malware or unauthorized access—while maintaining functionality for users who specifically require NovaTrack or Rehab.

Modernization Roadmap

We are aware of the need to solve this issue in the Novapoint software. The development timeline is not yet set on when to finalize the solution.

How to install Novapoint Rehab and NovaTrack

Run Setup.Exe from the folder INSTALL.

Both softwares will be installed.
